

Eastfield Farms Out Interest in Hedge Hog Project

Vancouver, B.C., Dec 29, 2020, Eastfield Resources Ltd. (TSX-V: ETF) (“Eastfield”) has optioned a 60% interest in its Hedge Hog copper, gold, silver, cobalt project located in the Cariboo Mining Division, BC to privately controlled West Oak Gold Corp. (“West Oak”). To earn its interest, West Oak must make payments (cash and/or shares) totaling \$377,500 and complete \$1,750,000 in exploration over a 4 year term. Upon completion of the earn-in Eastfield will retain a 40% working interest and a 0.5% Net Smelter Return royalty. The Hedge Hog Project is located approximately 12 kilometres north of the community of Barkerville, BC where Barkerville Gold Mines (owned by Osisko Gold Royalties) is currently conducting a major exploration program. The most obvious target type at Hedge Hog is a “Cyprus Style” volcanic massive sulfide deposit comparable in genesis and character to deposits on the Island of Cyprus and the Windy Craggy and Chu Chua deposits in British Columbia. A historic placer gold mine on the Hedge Hog property and the proximity to Barkerville suggests further potential for gold.

Central to the Hedge Hog project is the Lottie Zone where massive sulfide boulders with high concentrations of copper, silver and cobalt were discovered approximately 20 years ago. The most extensive exploration in the area of the current Hedgehog claims was completed by Hudson Bay Exploration and Development (“Hudbay”) between 1999 and 2001 with airborne and ground based geophysical surveys, extensive geochemical surveys, mechanical excavator trenching and six short diamond drill holes. In 1999 a massive sulfide boulder grading 24.3% copper and 19.6 g/t silver was discovered. In 2000 Hudbay completed an excavator trenching program near the 1999 discovery and discovered five additional massive chalcopyrite rich boulders with an average grade of 8.8% copper, 9.6 g/t silver. In addition to the chalcopyrite rich boulders a pyrite rich massive sulfide boulder grading 0.13% cobalt was discovered. Hudbay was nevertheless unsuccessful in locating the bedrock source of these boulders and ceased exploration in 2001. During Hudbay’s exploration of the current claims, massive sulfide boulders were also discovered 6.5 kilometres northeast of Lottie in an area named Khan-khan (also on the Hedge Hog property).

In 2013, Eastfield discovered the Golden Sky showing, a new area of mineralization, approximately eight kilometres north of Lottie. At Golden Sky, quartz veins hosted in sheared rhyolite returned grab samples to 1.51 g/t gold, 1.37% zinc, 0.48% lead, 1,203 ppm arsenic and 1,313 ppm antimony (in addition to lower grade or unmineralized samples). A soil grid was established at Golden Sky in 2014 but no follow up or further work has since been completed.
